# Preface

“Art is the lie that enables us to realize the truth.”

—Picasso

## Acknowledgments

This report has benefitted from numerous individuals during its development. The Curve Number Hydrology Task Committee membership has varied since its creation, but early membership included (in addition to the authors of the report) Richard H. Berich, Allen Hjelmfelt, Jr., Richard H. McCuen, Norman Miller, Jit Pagano, Victor Miguel Ponce, Kenneth G. Renard, and Zhida Song-James. Several of these individuals represented the Surface Water Technical Committee and/or the Watershed Management Technical Committee of the EWRI/ASCE.

The authors acknowledge the many contributions that were freely given, and the significant roles by the following, in generating this report, and to a larger extent to the ongoing creation and evolution of the Curve Number “method” itself: James V. Bonta, Cheng-lung Chen, Mark M. Dripchak, Allen T. Hjelmfelt, Jr., Rollin H. Hotchkiss, Ruiyun Jiang, Paul A. Lawrence, Richard H. McCuen, S.K. Mishra, Victor Miguel Ponce, Robert E. Rallison, Kenneth G. Renard, P. DeAnne Rietz, J. Marvin Rosa, Roland Schulze, J. Roger Simanton, Maria J. Simas, Vijay P. Singh, Ghassem Sobhani, Everett P. Springer, and Kevin E. VerWeire. The authors also wish to thank James V. Bonta, Paul DeBarry, Allen T. Hjelmfelt, Jr., Claudia Hoeft, Rollin H. Hotchkiss, Richard H. McCuen, and Kenneth G. Renard for their reviews of an early draft of this report. Their time and critical comments are greatly appreciated.

Thanks are also due to the Arizona Agricultural Experiment Station, which supported one of the authors (Hawkins) over the duration of this work.

Very special recognition must go posthumously to Victor Mockus (August 8, 1913–May 22, 1997). While generally unappreciated in the applied hydrology community, it was his creative genius that brought the Curve Number method together from the different components.

## Limitations and Apologies

Given the finite time, energy, and intellectual resources available for this work, the viewpoint and reporting here is unavoidably slanted to North American experiences and use. Recent years have seen an explosion of Curve Number (CN) applications

and technical papers. Much of this mushrooming has been contemporary with the creation of this report, and universal up-to-date coverage is simply not possible.

International adaptation of the CN method has grown. An admirable CN subculture has evolved in India under the leaderships of S.K. Mishra and V.P. Singh and many co-workers. A similar well-developed technology has evolved in South Africa pioneered by Professor Roland E. Schulze. Although these were originally incubated in the USA, they have been further developed to meet specific user needs and technical expectations in their own social and technical environments. While only limited technical coverage is given to the international CN community in this report, the ongoing efforts and contributions are worthy of note.

The CN procedure is no longer a simple American agency method. Examples of interest, participation, in and adaptation to other international settings are provided by Boughton (1989) [Australia]; Reich (1962) [South Africa]; Ghile (2004) [Eritria]; Colombo and Sarfatti (2005?) [Italy and Eritrea]; Gebremeskel et al. (2005), and Perrone and Matramootoo (1998) [Canada]; Ignar et al. (1995), Ignar (1988, 1993), Banasik *et al* (1994) [Poland]; Kuntner(2002) [Switzerland]; Sobhani (1976)[Iran]; Al-Udani (1984) [Yemen]; Michel et al. (2005) [France]; Ponce et al.(2005) [Mexico]; Sartori et al. (2004) [Brazil]; Wang et al. (2006) [China]; Auersald and Haider(1996), Zaiss (1989), and Sartor (1996) [Germany]; Choi et al. (2002) [South Korea]; and Calvo et al. (2006) [Panama]. These examples are by no means exhaustive.

Much of the international interest is prompted by the wide array of associated agricultural and water quality models which have incorporated elements of the CN method for runoff generation and soil moisture management. These models seem to have achieved a life and user group of their own, and the CN components are used as a fixed background technology. This too is treated only in a recognition mode in this report. Investigations in this area do contribute markedly to the growing application of the procedure internationally, however.

With this as a background, the authors regret any misinterpretations, or any omissions of significant contributions: and such are by innocence or natural ignorance, and not by intent.

# List of Figures

1.	Rainfall and runoff depths for 482 events from 1939 to 1967 for watershed 44002, Hastings, Nebraska. ....	9
2.	Relationship of $I_a$ to $S$ , from NEH4 Table 10.2 .....	11
3.	Rainfall and direct runoff depth for different CNs. ....	12
4.	Dimensionless CN direct runoff equations .....	25
5.	Allocation of rainfall into water budget components within the CN equation.....	27
6.	Peak flow sensitivity comparisons for an urban runoff model based on HEC-1 .....	30
7.	Representation of the handbook AMC I, AMC II, AMC III relationships with double probability plotting .....	41
8.	Distribution of CN(I) and CN(III) with 10% and 90% Probability of Exceedance (POE) .....	42
9.	Complacent CN response to rainfall .....	51
10.	Standard CN response to rainfall.....	52
11.	Violent CN response to rainfall .....	53
12.	Comparison of CNs from watershed soils and land use with data-defined CNs .....	60
13.	Observed Curve Numbers and various handbook table and chart estimates .....	61

# List of Tables

1.	Research Watersheds used in the determination of NEH4 Curve Numbers .....	13
2.	Runoff Curve Numbers for Hydrologic Soil Cover Complexes, ARC II, and $I_a/S=0.2$ .....	14
3.	Hydrologic Soil Groups based on texture .....	15
4.	Minimum, central, and maximum handbook CNs for HSGs .....	16
5.	Curve Number Aligner equations .....	16
6.	CN-AMC relationships .....	17
7.	Antecedent Moisture classes defined by 5-day prior rain .....	18
8.	Summary of the components of the Curve Number Method .....	19
9.	Characteristic rainfall disposition fractions .....	27
10.	Hydrologic Soil Groups and infiltration capacities .....	34
11.	Criteria for placement of hydrologic soil groups .....	35
12.	Correlation Frequency between assigned and Fuzzy Modeled Hydrologic Soil Groups .....	36
13.	Values of Initial Abstraction ratio $\lambda=I_a/S$ from model fitting .....	37
14.	Conjugate Curve Numbers, $I_a$ and $P_{crit}$ .....	38
15.	Algebraic expressions of NEH4 Table 10.1 .....	40
