Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular, the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation of the voluntary nature of standards, the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT), see www.iso.org/iso/foreword.html.

This document was prepared by Technical Committee ISO/TC 59, *Buildings and civil engineering works*, Subcommittee SC 18, *Construction procurement*.

This second edition cancels and replaces the first edition (ISO 10845-2:2011), which has been technically revised.

The main changes compared to the previous edition are as follows:

- definitions and parts of the text have been updated and aligned with other parts of the ISO 10845 series to ensure consistency in concepts and terms;
- the three volume approach and colour separation of component documents has been removed;
- the scope of work requirements and guidance has been revised and expanded.

Any feedback or questions on this document should be directed to the user's national standards body. A complete listing of these bodies can be found at www.iso.org/members.html.

Introduction

Procurement documents are required to

- a) communicate the employer's procedures and requirements in calls for expressions of interest to respondents who wish to qualify to be invited to submit tender offers or to be admitted to a database,
- b) communicate the employer's procedures and requirements relating to the process of offer and acceptance when tenders are invited, solicit information to enable the employer to evaluate submissions and enable potential contractors to communicate their credentials and make an offer to an employer, and
- c) establish, in the contract between an employer and a contractor, the agreed terms and conditions, the prices, and the nature and quality of the goods, services or construction works that are required.

Procurement documents also:

- d) incorporate the employer's selected procurement strategy and tactics,
- e) capture the allocation of risks, liabilities and obligations of the parties, the procedures for the administration of the contract and the manner in which disputes may be resolved in the contract data, and
- f) provide the basis for
 - 1) paying the contractor,
 - 2) specifying any measurable, tangible, verifiable outcome, result or item that is to be produced or completed (deliverable) and the constraints in doing so, and
 - 3) in the case of construction works, communicating the outcomes of surveys and site conditions to tenderers, e.g. soil and ground conditions, the location and state of buildings or facilities that contractors might be expected to use or that might be affected by the contractor's activities, environmental conditions, the number and location of people who might be affected by the works, availability of materials, etc.

The format and the manner in which procurement documents are compiled and structured can be standardized. Uniformity in procurement documentation allows documents to be standardized, simplified and digitised. It also improves transparency, minimizes ambiguity and errors in and between the documents which make up a contract, enables tenderers to more accurately price the risks which they are to assume. Furthermore, it facilitates the development of standardized procurement documents which improves the effectiveness and efficiency of an organization's procurement system. It also enables the reader to readily locate the specific data and requirements they require if they have a working knowledge of the framework for the compilation of procurement documents provided in this document.

A uniform format for the compilation of calls for expressions of interest and tender and contract documents provides the framework for:

- the standardization of the component documents and improved communications between those engaged in the procurement process; and
- the digitisation of procurement documents.

The purpose of this document is to provide a common framework within which procurement documents may be developed and to establish general principles around which component documents should be developed.
