Introduction	x
1 Scope	1
2 Normative references	1
3 Terms and definitions	2
4 Symbols and abbreviated terms	13
4.1 Symbols	13
4.2 Abbreviated terms	16
5 Design and construction procedure	17
5.1 Procedure	17
5.1.1 Step A	17
5.1.2 Step B	17
5.1.3 Step C	17
5.1.4 Step D	17
5.1.5 Step E	17
5.1.6 Step F	17
5.1.7 Step G	17
5.1.8 Step H	17
5.1.9 Step I	17
5.1.10 Step J	18
5.1.11 Step K	18
5.2 Design documentation	19
5.2.1 General	19
5.2.2 Calculation memoir	19
5.2.3 Geotechnical report	19
5.2.4 Structural drawings	19
5.2.5 Specifications	19
6 General guides	19
6.1 Limitations	19
6.1.1 Occupancy	19
6.1.2 Maximum number of stories	20
6.1.3 Maximum area per floor	20
6.1.4 Maximum story height	20
6.1.5 Maximum span length	20
6.1.6 Maximum difference in span length	20
6.1.7 Minimum number of spans	21
6.1.8 Maximum cantilever span	21
6.1.9 Maximum slope for slabs, girders, beams and joists	21
6.1.10 Maximum slope of the terrain	21
6.1.11 Distance between centre of mass and centre of rigidity	21
6.2 Limit states	21
6.3 Ultimate limit state design format	21
6.3.1 General	21
6.3.2 Required factored strength	22
6.3.3 Design strength	22
6.4 Serviceability limit state design format	22
7 Specific guides	23
7.1 Structural systems and layout	23
7.1.1 Description of the components of the structure	23
7.1.2 General programme	24
7.1.3 Structural layout	25
7.1.4 Feasibility under the guidelines	28

8	Actions (loads)	29
8.1	General.....	29
8.1.1	Load factors and load combinations.....	29
8.1.2	Mass of materials.....	31
8.1.3	Dead loads.....	31
8.1.4	Live loads.....	32
8.1.5	Specified snow load.....	32
8.1.6	Specified wind forces.....	32
8.1.7	Specified earthquake forces.....	32
8.1.8	Seismic design base shear.....	39
9	General reinforced concrete requirements	40
9.1	General.....	40
9.2	Additional requirements.....	40
9.3	Materials for reinforced concrete.....	40
9.3.1	General.....	40
9.3.2	Cement.....	40
9.3.3	Aggregates.....	40
9.3.4	Water.....	40
9.3.5	Steel reinforcement.....	40
9.3.6	Admixtures.....	41
9.3.7	Storage of materials.....	41
9.3.8	Minimum and maximum reinforcement bar diameter.....	41
9.3.9	Concrete mixture specification.....	42
9.3.10	Concrete cover to reinforcement.....	42
9.3.11	Minimum reinforcement bend diameter.....	43
9.3.12	Standard hook dimensions.....	44
9.3.13	Bar spacing and maximum aggregate size.....	45
9.3.14	Maximum nominal coarse aggregate size.....	45
9.3.15	Minimum clear spacing between parallel bars in a layer.....	46
9.3.16	Minimum clear spacing between parallel layers of reinforcement.....	46
9.3.17	Minimum clear spacing between longitudinal bars in columns.....	47
9.3.18	Clear spacing between parallel lap splices.....	48
9.3.19	Maximum flexural reinforcement spacing in solid slabs.....	48
9.3.20	Maximum shrinkage and temperature reinforcement spacing in solid slabs.....	48
9.3.21	Maximum reinforcement spacing in structural concrete walls.....	49
9.3.22	Special details per element type.....	49
9.4	Development length, lap splicing and anchorage of reinforcement.....	49
9.4.1	Development length.....	49
9.4.2	Lap splice dimensions.....	51
9.4.3	Minimum standard hook anchorage distance.....	51
9.5	Limits for longitudinal reinforcement.....	52
9.5.1	General.....	52
9.5.2	Solid slabs and footings.....	52
9.5.3	Girders, beams and joists.....	53
9.5.4	Columns.....	55
9.5.5	Structural concrete walls.....	55
9.6	Minimum amounts of transverse reinforcement.....	56
9.6.1	General.....	56
9.6.2	Slabs.....	56
9.6.3	Girders, beams and joists.....	56
9.6.4	Columns.....	56
9.6.5	Structural concrete walls.....	60
9.7	Strength of members subjected to bending moments.....	61
9.7.1	General.....	61
9.7.2	Factored bending moment at section.....	61
9.7.3	Minimum design bending moment strength.....	61
9.7.4	Design moment strength for rectangular sections with tension reinforcement only.....	61

9.7.5	Use of compression reinforcement in girders, beams, and joists	62
9.7.6	T-beam effect	64
9.8	Strength of members subjected to shear stresses	66
9.8.1	General	66
9.8.2	Factored shear	67
9.8.3	Design shear strength	67
9.8.4	Beam-action shear	67
9.8.5	Two-way action shear (punching shear) in solid slabs and footings	70
10	Floor systems	71
10.1	Types of floor systems	71
10.1.1	General	71
10.1.2	Slab-on-girder system	71

Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

The procedures used to develop this document and those intended for its further maintenance are described in the ISO/IEC Directives, Part 1. In particular the different approval criteria needed for the different types of ISO documents should be noted. This document was drafted in accordance with the editorial rules of the ISO/IEC Directives, Part 2 (see www.iso.org/directives).

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights. Details of any patent rights identified during the development of the document will be in the Introduction and/or on the ISO list of patent declarations received (see www.iso.org/patents).

Any trade name used in this document is information given for the convenience of users and does not constitute an endorsement.

For an explanation on the meaning of ISO specific terms and expressions related to conformity assessment, as well as information about ISO's adherence to the World Trade Organization (WTO) principles in the Technical Barriers to Trade (TBT) see the following URL: www.iso.org/iso/foreword.html.

The committee responsible for this document is ISO/TC 71, *Concrete, reinforced concrete and prestressed concrete*, Subcommittee SC 5, *Simplified design standard for concrete structures*.

This second edition cancels and replaces the first edition (ISO 15673:2005), which has been technically revised with the following changes.

- recent research available in concrete frame and wall buildings as a result of poor structural behaviour observed during recent earthquakes have changed the design and detailing requirements for these type of buildings in seismic prone areas;
- concrete structural design criteria has been unified in almost all countries in order to use similar, if not identical load combinations with the same load factors, as well as strength reduction factors; this is a substantial change and has been changing in recent years in order to simplify and unify design criteria for different construction materials such as timber, steel, masonry and lastly concrete;
- concrete cover requirement have been updated to most recent international building code standards.

Introduction

This document is developed for countries that do not have existing national standards. This document should not be used in place of a national standard unless specifically considered and accepted by the national standard body or other appropriate regulatory organization. The design rules are based in simplified worldwide-accepted strength models. This document is self-contained; therefore, actions (loads) and simplified analysis procedures are included, as well as minimum acceptable construction practice guidelines.

The minimum dimensional guidelines contained in this document are intended to account for undesirable side effects that will require more sophisticated analysis and design procedures. Material and construction guidelines are aimed at site mixed concrete, as well as ready-mixed concrete, and steel of the minimum available strength grades.

The earthquake resistance guidelines are included to account for the fact that numerous underdeveloped regions of the world lay in earthquake prone areas. The earthquake resistance is based upon the employment of structural concrete walls (shear walls) that limit the lateral deformations of the structure and provide for its lateral strength.

This document contains guidelines that can be modified by the national standards body due to local design and construction requirements and practices. These guidelines that can be modified are included using [*boxed values*]. The authorities in each member country are expected to review the “boxed values” and may substitute alternative definitive values for these elements for use in the national application of the document.

A great effort was made to include self-explanatory tables, graphics, and design aids to simplify the use of this document and provide foolproof procedures. Notwithstanding, the economic implications of the conservatism inherent in approximate procedures as a substitution to sound and experienced engineering is to be a matter of concern to the designer that employs this document, and to the owner that hires him/her.

The purpose of these guidelines is to provide a registered civil engineer or architect with sufficient information to perform the design of the structural reinforced concrete that comprises the structural framing of a low-rise building that complies with the limitations established in [6.1](#). The rules of design as set forth in the present document are simplifications of the more elaborate requirements.

Although the guidelines contained in this document were drawn to produce, when properly employed, a reinforced concrete structure with an appropriate margin of safety, these guidelines are not a replacement of sound and experienced engineering judgement. In order for the resulting structure to attain the intended margin of safety, this document should be used as a whole, and alternative procedures should be employed only when explicitly permitted by the guidelines. The minimum dimensioning guides provided replace, in most cases, more elaborate procedures as those prescribed in the National Building Code, and the eventual economic impact is compensated by the simplicity of the procedures prescribed in this document.

The professional performing the structural design under these guidelines should meet the legal requirements for structural designers in the country of adoption possess a minimum appropriate knowledge of structural mechanics, statics, strength of materials, structural analysis, and reinforced concrete design and construction.
